stemgraphic Documentation

Release 0.8.3

Francois Dion

CONTENTS:

INTRODUCTION

John Tukey's stem-and-leaf plot first appeared in 1970. Although very useful back then, it cannot handle more than 300 data points and is completely text-based. Stemgraphic is a very easy to use python package providing a solution to these limitations.

A typical stem_graphic output:

```
Key: aggr|stem|leaf
  146
                             = 14.1 x10 = 141.0

For an in depth look at the algorithms and the design of stemgraphic, see

https://github.com/fdion/stemgraphic/raw/master/doc/stemgraphic%20A%20Stem-and-Leaf%20Plot%20for%20the%20Age%20of%20Big%20Data.pdf

A PDF version of the documentation is available at: http://stemgraphic.org/doc/stemgraphic.pdf The official website of stemgraphic is: http://stemgraphic.org

CHAPTER

TWO

INSTALLATION

Stemgraphic requires docopt, matplotlib, pandas and seaborn. Optionally, having Scipy installed will give you secondary plots, cufflinks for interactive plots and Dask (see requirements_dev.txt for all needed to run all the functional tests) will allow for out of core, big data visualization.

If you use conda, it is recommended you conda install docopt, matplotlib, pandas, seaborn, and scipy before doing a pip install of stemgraphic.

Installation of stemgraphic is simple:

pip3 install -U stemgraphic

or from a clone of the github repository, in the package root:

 $python 3\ setup.py\ install$

STEMGRAPHIC QUICKSTART WITH NUMBERS

Import stem_graphic from stemgraphic (shortcut) or explicitely from stemgraphic.num.

```
[1]: %matplotlib inline
import pandas as pd
from stemgraphic import stem_graphic
```

Load a data frame

```
[2]: df = pd.read_csv('../iris.csv')
```

```
[3]: df.describe()
```

| | 3-1-1-3-3-3-3-1-3-1-1-1-1-1-1-1-1-1-1-1 | | | | | |
|------|-----------------------------------------|--------------|-------------|--------------|-------------|--|
| [3]: | | sepal_length | sepal_width | petal_length | petal_width | |
| | count | 150.000000 | 150.000000 | 150.000000 | 150.000000 | |
| | mean | 5.843333 | 3.054000 | 3.758667 | 1.198667 | |
| | std | 0.828066 | 0.433594 | 1.764420 | 0.763161 | |
| | min | 4.300000 | 2.000000 | 1.000000 | 0.100000 | |
| | 25% | 5.100000 | 2.800000 | 1.600000 | 0.30000 | |
| | 50% | 5.800000 | 3.000000 | 4.350000 | 1.300000 | |
| | 75% | 6.400000 | 3.300000 | 5.100000 | 1.800000 | |
| | max | 7.900000 | 4.400000 | 6.900000 | 2.500000 | |

Select a column, or pass the whole dataframe if you want stem_graphic to select the first numerical column.

```
[4]: stem_graphic(df['sepal_length']);
```

```

| max | K | 7.900000 | 4.400000 | 6.900000 | 2.500000 | NaN | |

Select a column with text.

From this, we see we have 50 setosa, 50 versicolor and 50 virginica, but you probably already knew that!

```
[ ]:
```

STEMGRAPHIC QUICKSTART WITH TEXT

 $Import\ stem_graphic\ from\ stemgraphic.alpha$

```
[2]: %matplotlib inline
from stemgraphic.alpha import stem_graphic
```

Load words from a text file on disk.

[]:

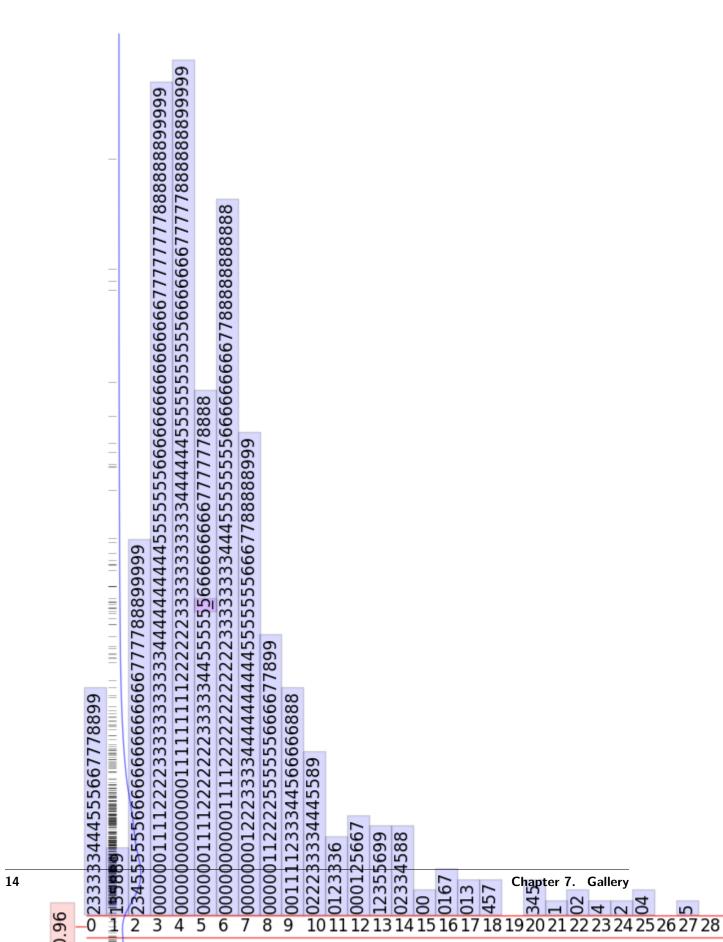

INCLUDED STOP WORDS

```
Very short list of English stop words
[2]: len(ALT EN)
[2]: 27
[3]: print(ALT EN)
     ['a', 'am', 'an', 'and', 'are', 'as', 'at', 'been', 'for', 'from', 'in', 'is',
     → 'of', 'on', 'or', 'out', 'so', 'such', 'that', 'the', 'these', 'this', □
      →'those', 'to', 'upon', 'was', 'were']
     The French and Spanish stop words are quite similar, but Spanish has several gender specific words (i.e.
     quelque vs. algun, algunos, algunas) so it is larger.
[4]: len(FR)
[4]: 127
[5]: len(ES)
[5]: 183
     The main English stop word list is significantly larger.
[6]: len(EN)
[6]: 316
[]:
```

[1]: from stemgraphic.stopwords import EN, FR, ES, ALT EN

STEMGRAPHIC MODULES

8.1 stemgraphic

stem_graphic

Package implementing a complete toolkit for text and a graphical stem-and-leaf plots and other visualizations adapted to stem-and-leaf pair values, such as heatmaps and sunburst charts.

It also handles very large data sets through scaling, sampling, trimming and other techniques.

See research paper (http://artchiv.es/pydata2016/stemgraphic) for more technical details.

A command line utility was installed along with the package, allowing to process excel or csv files. See: stem -h

8.2 aliases

Handy aliases for stem_graphic options.

```
stemgraphic.aliases. \textbf{stem\_hist}(x, aggregation = False, alpha = 1, asc = True, column = None, \\ color = 'b', delimiter\_color = 'r', display = 300, flip\_axes = True, \\ legend\_pos = 'short', outliers = False, trim = False)
```

stem_hist builds a graphical histogram matching the stem-and-leaf plot, with the numbers hidden, as shown on the cover of the companion brochure.

Parameters

- legend pos -
- x list, numpy array, time series, pandas or dask dataframe
- aggregation Boolean for sum, else specify function
- alpha opacity of the bars, median and outliers, defaults to 15%
- asc stem sorted in ascending order, defaults to True
- **column** specify which column (string or number) of the dataframe to use, else the first numerical is selected
- color the bar facecolor
- delimiter_color color of the line between aggregate and stem and stem and leaf
- **display** maximum number of data points to display, forces sampling if smaller than len(df)

- flip axes X becomes Y and Y becomes X
- outliers this is NOP, for compatibility
- trim this is NOP, for compatibility

Returns matplotlib figure and axes instance

```
stemgraphic.aliases.stem kde(x, **kw args)
```

stem_kde buils a stem-and-leaf plot and adds an overlaid kde as secondary plot.

Parameters

- x list, numpy array, time series, pandas or dask dataframe
- kw args -

Returns matplotlib figure and axes instance

```
stemgraphic.aliases. \textbf{stem\_line} (x, aggregation=False, alpha=0, asc=True, column=None, \\ color='k', delimiter\_color='r', display=300, flip\_axes=True, \\ outliers=False, secondary\_plot=None, trim=False) \\ stem\_line builds a stem-and-leaf plot with lines instead of bars.
```

Parameters

- x list, numpy array, time series, pandas or dask dataframe
- aggregation Boolean for sum, else specify function
- alpha opacity of the bars, median and outliers, defaults to 15%
- asc stem sorted in ascending order, defaults to True
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- color the color of the line
- **delimiter_color** color of the line between aggregate and stem and stem and leaf
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes X becomes Y and Y becomes X
- outliers -
- **secondary_plot** One or more of 'dot', 'kde', 'margin_kde', 'rug' in a comma delimited string or None
- trim this is NOP, for compatibility

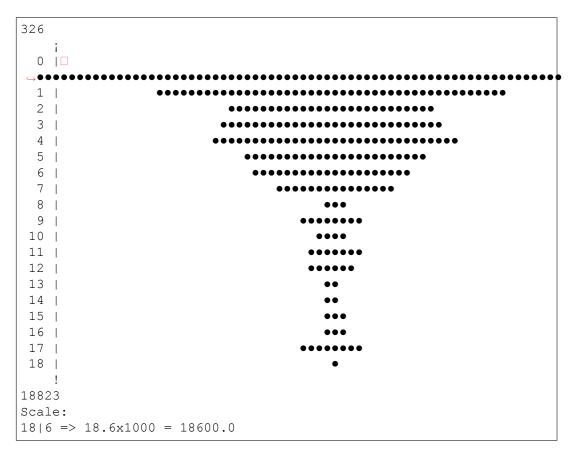

Returns matplotlib figure and axes instance

```
stemgraphic.aliases.stem_symmetric_dot(x, **kw_args) stem_symmetric_dot builds a symmetric stem dot plot
```

Example:

```
stem_symmetric_dot(diamonds.price)
```

Output:

Parameters

- **x** list, numpy array, time series, pandas or dask dataframe
- kw args keyword args to stem_dot

Returns

8.3 alpha

stemgraphic.alpha.

BRAND NEW in V.0.5.0!

Stemgraphic provides a complete set of functions to handle everything related to stem-and-leaf plots. alpha is a module of the stemgraphic package to add support for categorical and text variables.

The module also adds functionality to handle whole words, beside stem-and-leaf bigrams and n-grams.

For example, for the word "alabaster":

With **word**_ functions, we can look at the word frequency in a text, or compare it through a distance function (default to Levenshtein) to other words in a corpus

With **stem**__ functions, we can look at the fundamental stem-and-leaf, stem would be 'a' and leaf would be '1', for a bigram 'al'. With a stem__order of 1 and a leaf__order of 2, we would have 'a' and 'la', for a trigram 'ala', so on and so forth.

stemgraphic.alpha.add_missing_letters (mat, stem_order, leaf_order, letters=None)
Add missing stems based on LETTERS. defaults to a-z alphabet.

Parameters

- mat matrix to modify
- stem order how many stem characters per data point to display, defaults to 1
- leaf order how many leaf characters per data point to display, defaults to 1
- letters letters that must be present as stems

Returns the modified matrix

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the they are left in their respective columns. Row 'a' and Column 'b' would have the count of words starting with 'ab'. The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

Parameters

- src string, filename, url, list, numpy array, time series, pandas or dask dataframe
- alpha only only use stems from a-z alphabet
- annotate display annotations (Z) on heatmap
- asFigure return plot as plotly figure (for web applications)
- ax matplotlib axes instance, usually from a figure or other plot
- caps bool, True to be case sensitive
- compact remove empty stems
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- interactive if cufflinks is loaded, renders as interactive plot in notebook
- leaf order how many leaf characters per data point to display, defaults to 1
- **leaf_skip** how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi', 'woo', 'woo'
- random_state initial random seed for the sampling process, for reproducible research
- stem order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

Returns

heatmap_grid.

With stem_graphic, it is possible to directly compare two different sources. In the case of a heatmap, two different data sets cannot be visualized directly on a single heatmap. For this task, we designed heatmap_grid to adapt to the number of sources to build a layout. It can take from 2 to 4 different source.

With 2 sources, a square grid will be generated, allowing for horizontal and vertical comparisons, with an extra heatmap showing the difference between the two matrices. It also computes a norm for that difference matrix. The smaller the value, the closer the two heatmaps are.

With 3 sources, it builds a triangular grid, with each source heatmap in a corner and the difference between each pair in between.

Finally, with 4 sources, a 3 x 3 grid is built, each source in a corner and the difference between each pair in between, with the center expressing the difference between top left and bottom right diagonal.

Parameters

- **src1** string, filename, url, list, numpy array, time series, pandas or dask dataframe (required)
- src2 string, filename, url, list, numpy array, time series, pandas or dask dataframe (required)
- src3 string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional)
- **src4** string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional)
- alpha only only use stems from a-z alphabet
- annot display annotations (Z) on heatmap
- **caps** bool, True to be case sensitive, defaults to False, recommended for comparisons.
- **center** the center of the divergent color map for the difference heatmaps
- cmap color map for difference heatmap or None (default) to use the builtin red / blue divergent map
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- leaf_order how many leaf characters per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi', 'woo'
- robust reduce effect of outliers on difference heatmap
- random_state initial random seed for the sampling process, for reproducible research
- stem_order how many stem characters per data point to display, defaults to 1

- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- threshold absolute value minimum count difference for a difference heatmap element to be visible

Returns

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the they are left in their respective columns. Row 'a' and Column 'b' would have the count of words starting with 'ab'. The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

Parameters

- src string, filename, url, list, numpy array, time series, pandas or dask dataframe
- alpha only only use stems from a-z alphabet
- caps bool, True to be case sensitive
- charset -
- column specify which column (string or number) of the dataframe to use, else the first is selected
- compact remove empty stems
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes wide format
- leaf order how many leaf characters per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'wol','wor','woo'
- outliers for compatibility with other text plots
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- stem_order how many stem characters per data point to display, defaults to 1
- stem_skip how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- scale force a specific scale for building the plot. Defaults to None (automatic).

- trim ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- zero blank replace zero digit with space
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns count matrix, scale

stemgraphic.alpha.matrix difference (mat1, mat2, thresh=0, ord=None)

Parameters

- mat1 first heatmap dataframe
- mat2 second heatmap dataframe
- thresh -: absolute value minimum count difference for a difference heatmap element to be visible

Returns difference matrix, norm and ratio of the sum of the first matrix over the second

```
stemgraphic.alpha.ngram data(df,
                                         alpha only=False,
                                                              ascending = True,
                                                                                binary=False,
                                    break\_on=None.
                                                       caps=False,
                                                                      char filter=None.
                                    umn=None, compact=False, display=750,
                                    leaf\_skip=0, persistence=None, random\_state=None, re-
                                    move\_accents = False,
                                                            reverse = False,
                                                                             rows_only = True,
                                    sort\_by='len',
                                                          stem\_order=1,
                                                                                stem_skip=0,
                                    stop words=None)
```

This is the main text ingestion function for stemgraphic.alpha. It is used by most of the visualizations. It can also be used directly, to feed a pipeline, for example.

If selected (rows_only=False), the returned dataframe includes in each row a single word, the stem, the leaf and the ngram (stem + leaf) - the index is the 'token' position in the original source:

word stem leaf ngram

12 salut s a sa 13 chéri c h ch

Parameters

- df list, numpy array, series, pandas or dask dataframe
- alpha_only only use stems from a-z alphabet (NA on dataframe)
- ascending bool if the sort is ascending
- binary bool if True forces counts to 1 for anything greater than 0
- break on letter on which to break a row, or None (default)
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- **char_filter** list of characters to ignore. If None (default) CHAR_FILTER list will be used
- **column** specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.

- compact remove empty stems
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- leaf order how many leaf characters per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi','woo'
- **persistence** will save the sampled datafrae to filename (with csv or pkl extension) or None
- random_state initial random seed for the sampling process, for reproducible research
- remove accents bool if True strips accents (NA on dataframe)
- rows_only bool by default returns only the stem and leaf rows. If false, also the matrix and dataframe
- sort_by default to 'len', can also be 'alpha'
- stem_order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

Returns ordered rows if rows_only, else also returns the matrix and dataframe

 $\label{eq:control_sunburst_level} \begin{tabular}{ll} stemgraphic.alpha.plot_sunburst_level (normalized, ax, label=True, level=0, offset=0, ngram=False, plot=True, stem=None, vis=0) \\ utility function for sunburst function. \end{tabular}$

Parameters

- normalized -
- ax -
- label -
- level -
- ngram -
- offset -
- plot -
- stem -
- vis -

Returns

stemgraphic.alpha.polar_word_plot(ax, word, words, label, min_dist, max_dist, metric, off-set, step)

Utility function for radar plot.

Parameters

- ax matplotlib ax
- word string, the reference word that will be placed in the middle

- words list of words to compare
- label bool if True display words centered at coordinate
- min_dist minimum distance based on metric to include a word for display
- max dist maximum distance for a given section
- **metric** any metric function accepting two values and returning that metric in a range from 0 to x
- offset where to start plotting in degrees
- step how many degrees to step between plots

Returns

stemgraphic.alpha.radar(word, comparisons, ascending=True, display=100, label=True, metric=None, $min_distance=1$, $max_distance=None$, $random_state=None$, $sort_by='alpha'$)

The radar plot compares a reference word with a corpus. By default, it calculates the levenshtein distance between the reference word and each words in the corpus. An alternate distance or metric function can be provided. Each word is then plotted around the center based on 3 criteria.

- 1) If the word length is longer, it is plotted on the left side, else on the right side.
- 2) Distance from center is based on the distance function.
- 3) the words are equidistant, and their order defined alphabetically or by count (only applicable if the corpus is a text and not a list of unique words, such as a password dictionary).

Stem-and-leaf support is upcoming.

Parameters

- word string, the reference word that will be placed in the middle
- comparisons external file, list or string or dataframe of words
- ascending bool if the sort is ascending
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- label bool if True display words centered at coordinate
- metric Levenshtein (default), or any metric function accepting two values and returning that metric
- min_distance minimum distance based on metric to include a word for display
- max_distance maximum distance based on metric to include a word for display
- random_state initial random seed for the sampling process, for reproducible research
- sort by default to 'alpha', can also be 'len'

Returns

 $stemgraphic.alpha. \textbf{scatter} (src1, src2, src3=None, alpha=0.5, alpha_only=True, ascending=True, asFigure=False, ax=None, caps=False, compact=True, display=None, fig_xy=None, interactive=True, jitter=False, label=False, leaf_order=1, leaf_skip=0, log_scale=True, normal-ize=None, percentage=None, project=False, project_only=False, random_state=None, sort_by='alpha', stem_order=1, stem_skip=0, stop_words=None, whole=False)$

With 2 sources:

Scatter compares the word frequency of two sources, on each axis. Each data point Z value is the word or stem-and-leaf value, while the X axis reflects that word/ngram count in one source and the Y axis reflect the same word/ngram count in the other source, in two different colors. If one word/ngram is more common on the first source it will be displayed in one color, and if it is more common in the second source, it will be displayed in a different color. The values that are the same for both sources will be displayed in a third color (default colors are blue, black and pink.

With 3 sources:

The scatter will compare in 3d the word frequency of three sources, on each axis. Each data point hover value is the word or stem-and-leaf value, while the X axis reflects that word/ngram count in the 1st source, the Y axis reflects the same word/ngram count in the 2nd source, and the Z axis the 3rd source, each in a different color. If one word/ngram is more common on the 1st source it will be displayed in one color, in the 2nd source as a second color and if it is more common in the 3rd source, it will be displayed in a third color. The values that are the same for both sources will be displayed in a 4th color (default colors are blue, black, purple and pink.

In interactive mode, hovering the data point will give the precise counts on each axis along with the word itself, and filtering by category is done by clicking on the category in the legend. Double clicking a category will show only that category.

Parameters

- src1 string, filename, url, list, numpy array, time series, pandas or dask dataframe
- src2 string, filename, url, list, numpy array, time series, pandas or dask dataframe
- src3 string, filename, url, list, numpy array, time series, pandas or dask dataframe,
 optional

:param alpha:: opacity of the dots, defaults to 50% :param alpha_only: only use stems from a-z alphabet (NA on dataframe) :param ascending: word/stem count sorted in ascending order, defaults to True :param asFigure: return plot as plotly figure (for web applications) :param ax: matplotlib axes instance, usually from a figure or other plot :param caps: bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe) :param compact: do not display empty stem rows (with no leaves), defaults to False :param display: maximum number of data points to display, forces sampling if smaller than len(df) :param fig xy: tuple for matplotlib figsize, defaults to (20,20) :param interactive: if cufflinks is loaded, renders as interactive plot in notebook :param jitter: random noise added to help see multiple data points sharing the same coordinate :param label: bool if True display words centered at coordinate :param leaf order: how many leaf digits per data point to display, defaults to 1 :param leaf_skip: how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: 'wol', 'woo' :param log_scale: bool if True (default) uses log scale axes (NA in 3d due to open issues with mpl, cufflinks) :param normalize: bool if True normalize frequencies in src2 and src3 relative to src1 length :param percentage: coordinates in percentage of maximum word/ngram count (in non interactive mode) :param project: project src1/src2 and src1/src3 comparisons on X=0 and Z=0 planes :param project only: only show the projection (NA if project is False) :param random state: initial random seed for the sampling process, for reproducible research :param sort by: sort by 'alpha' (default) or 'count' :param stem_order: how many stem characters per data point to display, defaults to 1 :param stem skip: how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter :param stop words: stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French): param whole: for normalized or percentage, use whole integer values (round):return: matplotlib ax, dataframe with categories

```
stemgraphic.alpha.stem\_freq\_plot(df, alpha\_only=False, asFigure=False, column=None, compact=True, caps=False, display=2600, interactive=True, kind='barh', leaf\_order=1, leaf\_skip=0, random\_state=None, stem\_order=1, stem\_skip=0, stop\_words=None)
```

Word frequency plot is the most common visualization in NLP. In this version it supports stem-and-leaf / n-grams.

Each row is the stem, and similar leaves are grouped together and each different group is stacked in bar charts.

Default is horizontal bar chart, but vertical, histograms, area charts and even pie charts are supported by this one visualization.

Parameters

- df string, filename, url, list, numpy array, time series, pandas or dask dataframe
- alpha_only only use stems from a-z alphabet (NA on dataframe)
- asFigure return plot as plotly figure (for web applications)
- **column** specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.
- compact do not display empty stem rows (with no leaves), defaults to False
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- interactive if cufflinks is loaded, renders as interactive plot in nebook
- **kind** defaults to 'barh'. One of 'bar', 'barh', 'area', 'hist'. Non-interactive also supports 'pie'
- leaf_order how many leaf digits per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi', 'woo', 'woo'
- random_state initial random seed for the sampling process, for reproducible research
- stem order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

Returns

```
stemgraphic.alpha.stem graphic(df,
                                                                                                                                                                                         df2=None,
                                                                                                                                                                                                                                                aggregation = True,
                                                                                                                                                                                                                                                                                                                                 alpha=0.1,
                                                                                                                                                                  pha only=True,
                                                                                                                                                                                                                                                              ascending=False,
                                                                                                                                                                                                                                                                                                                                                              ax=None.
                                                                                                                                                                  ax2=None,

```

The principal visualization of stemgraphic.alpha is stem_graphic. It offers all the options of stem_text (3.1) and adds automatic title, mirroring, flipping of axes, export (to pdf, svg, png, through fig.savefig) and many more options to change the visual appearance of the plot (font size, color, background color, underlining and more).

By providing a secondary text source, the plot will enable comparison through a back-to-back display

Parameters

- df string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **df2** string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional). for back 2 back stem-and-leaf plots
- aggregation Boolean for sum, else specify function
- alpha opacity of the bars, median and outliers, defaults to 10%
- alpha only only use stems from a-z alphabet (NA on dataframe)
- ascending stem sorted in ascending order, defaults to True
- ax matplotlib axes instance, usually from a figure or other plot
- ax2 matplotlib axes instance, usually from a figure or other plot for back to back
- bar color the fill color of the bar representing the leaves
- bar outline the outline color of the bar representing the leaves
- **break_on** force a break of the leaves at that letter, the rest of the leaves will appear on the next line
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- **column** specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.
- combined list (specific subset to automatically include, say, for comparisons), or None
- compact do not display empty stem rows (with no leaves), defaults to False
- delimiter_color color of the line between aggregate and stem and stem and leaf
- display maximum number of data points to display, forces sampling if smaller than len(df)

- figure_only bool if True (default) returns matplotlib (fig,ax), False returns (fig,ax,df)
- flip axes X becomes Y and Y becomes X
- font kw keyword dictionary, font parameters
- leaf color font color of the leaves
- leaf_order how many leaf digits per data point to display, defaults to 1
- **leaf_skip** how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi', 'woo'
- legend pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- median color color of the box representing the median
- mirror mirror the plot in the axis of the delimiters
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- primary kw stem-and-leaf plot additional arguments
- \bullet ${\tt random_state}$ initial random seed for the sampling process, for reproducible research
- remove accents bool if True strips accents (NA on dataframe)
- reverse bool if True look at words from right to left
- secondary bool if True, this is a secondary plot mostly used for back-to-back plots
- show stem bool if True (default) displays the stems
- sort_by default to 'len', can also be 'alpha'
- stem order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- title string, or None. When None and source is a file, filename will be used.
- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- underline_color color of the horizontal line under the leaves, None for no display

Returns matplotlib figure and axes instance, and dataframe if figure_only is False

 $stemgraphic.alpha. \textbf{stem_scatter} (src1, src2, src3=None, alpha=0.5, alpha_only=True, ascending=True, asFigure=False, ax=None, caps=False, compact=True, display=None, fig_xy=None, interactive=True, jitter=False, label=False, leaf_order=1, leaf_skip=0, log_scale=True, normalize=None, percentage=None, project=False, project_only=False, random_state=None, sort_by='alpha', stem_order=1, stem_skip=0, stop_words=None, whole=False)$

stem_scatter compares the word frequency of two sources, on each axis. Each data point Z value is the

word or stem-and-leaf value, while the X axis reflects that word/ngram count in one source and the Y axis reflect the same word/ngram count in the other source, in two different colors. If one word/ngram is more common on the first source it will be displayed in one color, and if it is more common in the second source, it will be displayed in a different color. The values that are the same for both sources will be displayed in a third color (default colors are blue, black and pink. In interactive mode, hovering the data point will give the precise counts on each axis along with the word itself, and filtering by category is done by clicking on the category in the legend.

Parameters

- src1 string, filename, url, list, numpy array, time series, pandas or dask dataframe
- src2 string, filename, url, list, numpy array, time series, pandas or dask dataframe
- src3 string, filename, url, list, numpy array, time series, pandas or dask dataframe, optional

:param alpha:: opacity of the dots, defaults to 50% :param alpha only: only use stems from a-z alphabet (NA on dataframe) :param ascending: stem sorted in ascending order, defaults to True :param asFigure: return plot as plotly figure (for web applications) :param ax: matplotlib axes instance, usually from a figure or other plot :param caps: bool, True to be case sensitive, defaults to False, recommended for comparisons. (NA on dataframe): param compact: do not display empty stem rows (with no leaves), defaults to False: param display: maximum number of data points to display, forces sampling if smaller than len(df) :param fig_xy: tuple for matplotlib figsize, defaults to (20,20) :param interactive: if cufflinks is loaded, renders as interactive plot in notebook :param jitter: random noise added to help see multiple data points sharing the same coordinate :param label: bool if True display words centered at coordinate :param leaf order: how many leaf digits per data point to display, defaults to 1 :param leaf skip: how many leaf characters to skip, defaults to 0 - useful w/shared bigrams: 'wol', 'woo', 'woo' :param log scale: bool if True (default) uses log scale axes (NA in 3d due to open issues with mpl, cufflinks): param normalize: bool if True normalize frequencies in src2 and src3 relative to src1 length :param percentage: coordinates in percentage of maximum word/ngram count :param random_state: initial random seed for the sampling process, for reproducible research :param sort by: sort by 'alpha' (default) or 'count' :param stem order: how many stem characters per data point to display, defaults to 1 :param stem skip: how many stem characters to skip, defaults to 0 - useful to zoom in on a single root letter :param stop words: stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French) :param whole: for normalized or percentage, use whole integer values (round) :return: matplotlib polar ax, dataframe

```
stemgraphic.alpha. \textbf{stem\_sunburst} (words, alpha\_only=True, ascending=False, caps=False, compact=True, display=None, hole=True, label=True, leaf\_order=1, leaf\_skip=0, median=True, ngram=False, random\_state=None, sort\_by='alpha', statistics=True, stem\_order=1, stem\_skip=0, stop\_words=None, top=0) \\ Stem-and-leaf based sunburst. See sunburst for details
```

Parameters

- words string, filename, url, list, numpy array, time series, pandas or dask dataframe
- alpha only only use stems from a-z alphabet (NA on dataframe)
- ascending stem sorted in ascending order, defaults to True
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- compact do not display empty stem rows (with no leaves), defaults to False
- display maximum number of data points to display, forces sampling if smaller than len(df)

- hole bool if True (default) leave space in middle for statistics
- label bool if True display words centered at coordinate
- leaf_order how many leaf digits per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi', 'woo'
- median bool if True (default) display an origin and a median mark
- ngram bool if True display full n-gram as leaf label
- \bullet ${\tt random_state}$ initial random seed for the sampling process, for reproducible research
- sort by sort by 'alpha' (default) or 'count'
- **statistics** bool if True (default) displays statistics in center hole has to be True
- stem_order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- top how many different words to count by order frequency. If negative, this will be the least frequent

Returns

```
alpha\_only=True,
stemgraphic.alpha.stem text(df,
                                         aggr=False,
                                                                           ascending = True,
                                    nary=False,
                                                  break\_on=None, caps=True,
                                                                                  charset = None,
                                    column=None,
                                                       compact = False,
                                                                           display=750,
                                                                                            leg-
                                    end\_pos='top',
                                                       leaf\_order=1,
                                                                         leaf_skip=0,
                                                                                          persis-
                                    tence=None,
                                                      remove\_accents = False,
                                                                                  reverse = False.
                                    rows_only=False, sort_by='len', stem_order=1, stem_skip=0,
                                    stop_words=None, random_state=None)
```

Tukey's original stem-and-leaf plot was text, with a vertical delimiter to separate stem from leaves. Just as stemgraphic implements a text version of the plot for numbers, stemgraphic alpha implements a text version for words. This type of plot serves a similar purpose as a stacked bar chart with each data point annotated.

It also displays some basic statistics on the whole text (or subset if using column).

Parameters

- **df** list, numpy array, time series, pandas or dask dataframe
- aggr bool if True display the aggregated count of leaves by row
- alpha only only use stems from a-z alphabet (NA on dataframe)
- ascending bool if the sort is ascending
- binary bool if True forces counts to 1 for anything greater than 0
- break_on force a break of the leaves at that letter, the rest of the leaves will
 appear on the next line
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)

8.3. alpha 33

- **column** specify which column (string or number) of the dataframe to use, or group of columns (stems) else the frame is assumed to only have one column with words.
- compact do not display empty stem rows (with no leaves), defaults to False
- display maximum number of data points to display, forces sampling if smaller than len(df)
- leaf_order how many leaf characters per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'wol','woo', 'woo'
- legend pos where to put the legend: 'top' (default), 'bottom' or None
- **persistence** will save the sampled datafrae to filename (with csv or pkl extension) or None
- \bullet ${\tt random_state}$ initial random seed for the sampling process, for reproducible research
- remove_accents bool if True strips accents (NA on dataframe)
- reverse bool if True look at words from right to left
- rows_only by default returns only the stem and leaf rows. If false, also return
 the matrix and dataframe
- sort by default to 'len', can also be 'alpha'
- stem_order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)

 $stemgraphic.alpha. \textbf{sunburst} (words, alpha_only=True, ascending=False, caps=False, compact=True, display=None, hole=True, label=True, leaf_order=1, leaf_skip=0, median=True, ngram=True, random_state=None, sort_by='alpha', statistics=True, stem_order=1, stem_skip=0, stop_words=None, top=40)$

Word sunburst charts are similar to pie or donut charts, but add some statistics in the middle of the chart, including the percentage of total words targeted for a given

number of unique words (ie. top 50 words, 48% coverage).

With stem-and-leaf, the first level of the sunburst represents the stem and the second level subdivides each stem by leaves.

- words string, filename, url, list, numpy array, time series, pandas or dask dataframe
- alpha only only use stems from a-z alphabet (NA on dataframe)
- ascending stem sorted in ascending order, defaults to True
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- compact do not display empty stem rows (with no leaves), defaults to False

- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- hole bool if True (default) leave space in middle for statistics
- label bool if True display words centered at coordinate
- leaf order how many leaf digits per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'woi', 'woo'
- median bool if True (default) display an origin and a median mark
- ngram bool if True (default) display full n-gram as leaf label
- random_state initial random seed for the sampling process, for reproducible research
- statistics bool if True (default) displays statistics in center hole has to be True
- sort by sort by 'alpha' (default) or 'count'
- stem_order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- top how many different words to count by order frequency. If negative, this will be the least frequent

Returns matplotlib polar ax, dataframe

text heatmap

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the leaves, they are left in their respective columns. Row '42' and Column '7' would have the count of numbers starting with '427' of the given scale.

The heatmap is useful to look at patterns. For distribution, stem graphic is better suited.

Parameters

- **df** list, numpy array, time series, pandas or dask dataframe
- **column** specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes wide format
- leaf order how many leaf digits per data point to display, defaults to 1

8.3. alpha 35

- outliers for compatibility with other text plots
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- zero_blank replace zero digit with space
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns count matrix, scale

```
stemgraphic.alpha.word\_freq\_plot(src, alpha\_only=False, ascending=False, asFigure=False, caps=False, display=None, interactive=True, \\ kind='barh', random\_state=None, sort\_by='count', \\ stop words=None, top=100)
```

word frequency bar chart.

This function creates a classical word frequency bar chart.

Parameters

- **src** Either a filename including path, a url or a ready to process text in a dataframe or a tokenized format.
- alpha only words only if True, words and numbers if False
- ascending stem sorted in ascending order, defaults to True
- **asFigure** if interactive, the function will return a plotly figure instead of a matplotlib ax
- caps keep capitalization (True, False)
- **display** if specified, sample that quantity of words
- interactive interactive graphic (True, False)
- kind horizontal bar chart (barh) also 'bar', 'area', 'hist' and non interactive 'kde' and 'pie'
- random_state initial random seed for the sampling process, for reproducible research
- sort_by default to 'count', can also be 'alpha'
- stop words a list of words to ignore
- top how many different words to count by order frequency. If negative, this will be the least frequent

Returns text as dataframe and plotly figure or matplotlib ax

stemgraphic.alpha.word_radar (word, comparisons, ascending=True, display=100, label=True, $metric=None, min_distance=1, max_distance=None, random state=None, sort by='alpha')$

Radar plot based on words. Currently, the only type of radar plot supported. See 'radar' for more detail.

Parameters

- word string, the reference word that will be placed in the middle
- comparisons external file, list or string or dataframe of words
- ascending bool if the sort is ascending
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- label bool if True display words centered at coordinate
- **metric** any metric function accepting two values and returning that metric in a range from 0 to x
- min_distance minimum distance based on metric to include a word for display
- max distance maximum distance based on metric to include a word for display
- random_state initial random seed for the sampling process, for reproducible research
- sort_by default to 'alpha', can also be 'len'

Returns

 $\label{eq:scatter} stemgraphic.alpha.\textbf{word_scatter} (src1, src2, src3=None, alpha=0.5, alpha_only=True, ascending=True, asFigure=False, ax=None, caps=False, compact=True, display=None, fig_xy=None, interactive=True, jitter=False, label=False, leaf_order=None, leaf_skip=0, log_scale=True, normalize=None, percentage=None, random_state=None, sort_by='alpha', stem_order=None, stem_skip=0, stop_words=None, whole=False)$

Scatter compares the word frequency of two sources, on each axis. Each data point Z value is the word or stem-and-leaf value, while the X axis reflects that word count in one source and the Y axis reflect the same word count in the other source, in two different colors. If one word is more common on the first source it will be displayed in one color, and if it is more common in the second source, it will be displayed in a different color. The values that are the same for both sources will be displayed in a third color (default colors are blue, black and pink. In interactive mode, hovering the data point will give the precise counts on each axis along with the word itself, and filtering by category is done by clicking on the category in the legend.

Parameters

- src1 string, filename, url, list, numpy array, time series, pandas or dask dataframe
- src2 string, filename, url, list, numpy array, time series, pandas or dask dataframe
- **src3** string, filename, url, list, numpy array, time series, pandas or dask dataframe, optional
- alpha opacity of the bars, median and outliers, defaults to 10%
- alpha only only use stems from a-z alphabet (NA on dataframe)
- ascending stem sorted in ascending order, defaults to True
- asFigure return plot as plotly figure (for web applications)

8.3. alpha 37

- ax matplotlib axes instance, usually from a figure or other plot
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- compact do not display empty stem rows (with no leaves), defaults to False
- display maximum number of data points to display, forces sampling if smaller than len(df)
- fig xy tuple for matplotlib figsize, defaults to (20,20)
- interactive if cufflinks is loaded, renders as interactive plot in notebook
- jitter random noise added to help see multiple data points sharing the same coordinate
- label bool if True display words centered at coordinate
- leaf order how many leaf digits per data point to display, defaults to 1
- **leaf_skip** how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'wol','woo','woo'
- log_scale bool if True (default) uses log scale axes
- random_state initial random seed for the sampling process, for reproducible research
- sort_by sort by 'alpha' or 'count' (default)
- stem order how many stem characters per data point to display, defaults to 1
- stem_skip how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- whole for normalized or percentage, use whole integer values (round)

Returns matplotlib polar ax, dataframe

```
stemgraphic.alpha. \textbf{word\_sunburst} (words, alpha\_only=True, ascending=False, caps=False, compact=True, display=None, hole=True, label=True, leaf\_order=None, leaf\_skip=0, median=True, ngram=True, random\_state=None, sort\_by='alpha', statistics=True, stem\_order=None, stem\_skip=0, stop\_words=None, top=40)
```

Word based sunburst. See sunburst for details

- words string, filename, url, list, numpy array, time series, pandas or dask dataframe
- alpha only only use stems from a-z alphabet (NA on dataframe)
- ascending stem sorted in ascending order, defaults to True
- caps bool, True to be case sensitive, defaults to False, recommended for comparisons.(NA on dataframe)
- compact do not display empty stem rows (with no leaves), defaults to False
- display maximum number of data points to display, forces sampling if smaller than len(df)

- hole bool if True (default) leave space in middle for statistics
- label bool if True display words centered at coordinate
- leaf_order how many leaf digits per data point to display, defaults to 1
- leaf_skip how many leaf characters to skip, defaults to 0 useful w/shared bigrams: 'wol','woo', 'woo'
- median bool if True (default) display an origin and a median mark
- ngram bool if True (default) display full n-gram as leaf label
- \bullet ${\tt random_state}$ initial random seed for the sampling process, for reproducible research
- statistics bool if True (default) displays statistics in center hole has to be True
- sort by sort by 'alpha' (default) or 'count'
- stem_order how many stem characters per data point to display, defaults to 1
- **stem_skip** how many stem characters to skip, defaults to 0 useful to zoom in on a single root letter
- **stop_words** stop words to remove. None (default), list or builtin EN (English), ES (Spanish) or FR (French)
- top how many different words to count by order frequency. If negative, this will be the least frequent

Returns

8.4 graphic

Stemgraphic.graphic

Stemgraphic provides a complete set of functions to handle everything related to stem-and-leaf plots. Stemgraphic.graphic is a module implementing a graphical stem-and-leaf plot function and a stem-and-leaf heatmap plot function for numerical data.

```
stemgraphic.graphic.density plot(df,
                                             var=None,
                                                           ax=None,
                                                                      bins=None,
                                                                                   box=None,
                                         density = True,
                                                           density_fill=True,
                                                                                display=1000,
                                         fig \quad only = True,
                                                          fit=None, hist=None,
                                                                                  hues=None.
                                         hue\_labels=None,
                                                                jitter=None,
                                                                                  kind=None,
                                         leaf order=1,
                                                            legend = True,
                                                                             limit var=False,
                                         norm\_hist=None,
                                                            random\_state=None,
                                                                                   ruq=None,
                                         scale=None, singular=True, strip=None, swarm=None,
                                         title=None, violin=None, x min=0, x max=None,
                                         y axis label=True)
```

 $density_plot.$

Various density and distribution plots conveniently packaged into one function. Density plot normally forces tails at each end which might go beyond the data. To force min/max to be driven by the data, use limit_var. To specify min and max use x_min and x_max instead. Nota Bene: defaults to _decimation_ and _quantization_ mode.

See density_plot notebook for examples of the different combinations of plots.

Why this instead of seaborn:

8.4. graphic 39

Stem-and-leaf plots naturally quantize data. The amount of loss is based on scale and leaf_order and on the data itself. This function which wraps several seaborn distribution plots was added in order to compare various measures of density and distributions based on various levels of decimation (sampling, set through display) and of quantization (set through scale and leaf_order). Also, there is no option in seaborn to fill the area under the curve...

- **df** list, numpy array, time series, pandas or dask dataframe
- var variable to plot, required if df is a dataframe
- ax matplotlib axes instance, usually from a figure or other plot
- bins Specification of hist bins, or None to use Freedman-Diaconis rule
- box bool, if True plots a box plot. Similar to using violin, use one or the other
- density bool, if True (default) plots a density plot
- density_fill bool, if True (default) fill the area under the density curve
- **display** maximum number rows to use (1000 default) for calculations, forces sampling if < len(df)
- **fig_only** bool, if True (default) returns fig, ax, else returns fix, ax, max_peak, true min, true max
- fit object with fit method, returning a tuple that can be passed to a pdf method
- hist bool, if True plot a histogram
- hues optional, a categorical variable for multiple plots
- hue_labels optional, if using a column that is an object and/or categorical needing translation
- jitter for strip plots only, add jitter. strip + jitter is similar to using swarm, use one or the other
- **leaf_order** the order of magnitude of the leaf. The higher the order, the less quantization.
- legend bool, if True plots a legend
- limit_var use min / max from the data, not density plot
- norm_hist bool, if True histogram will be normed
- random_state initial random seed for the sampling process, for reproducible research
- **rug** bool, if True plot a rug plot
- scale force a specific scale for building the plot. Defaults to None (automatic).
- **singular** force display of a density plot using a singular value, by simulating values of each side
- **strip** bool, if True displays a strip plot
- swarm swarm plot, similar to strip plot. use one or the other
- title if present, adds a title to the plot
- violin bool, if True plots a violin plot. Similar to using box, use one or the other
- **x_min** force X axis minimum value. See also limit_var

- x max force Y axis minimum value. See also limit var
- y axis label bool, if True displays y axis ticks and label

Returns see fig_only

 $stemgraphic.graphic.heatmap (\textit{df}, annotate=False, asFigure=False, ax=None, column=None, compact=False, display=900, interactive=True, leaf_order=1, persistence=None, random_state=None, scale=None, trim=False, trim blank=True, unit=", zoom=None)$

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the leaves, they are left in their respective columns. Row '42' and Column '7' would have the count of numbers starting with '427' of the given scale.

The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

Parameters

- df list, numpy array, time series, pandas or dask dataframe
- annotate display annotations (Z) on heatmap
- asFigure return plot as plotly figure (for web applications)
- ax matplotlib axes instance, usually from a figure or other plot
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- display maximum number of data points to display, forces sampling if smaller than len(df)
- interactive if cufflinks is loaded, renders as interactive plot in notebook
- leaf order how many leaf digits per data point to display, defaults to 1
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns count matrix, scale and matplotlib ax or figure if interactive and as Figure are True

8.4. graphic 41

```
 \begin{array}{c} \texttt{stemgraphic.graphic.leaf\_scatter} (\textit{df}, \textit{alpha} = 0.1, \textit{asc} = \textit{True}, \textit{ax} = \textit{None}, \textit{break\_on} = \textit{None}, \\ \textit{column} = \textit{None}, & \textit{compact} = \textit{False}, & \textit{delimiter\_color} = 'C3', \\ \textit{display} = 900, & \textit{figure\_only} = \textit{True}, & \textit{flip\_axes} = \textit{False}, \\ \textit{font\_kw} = \textit{None}, & \textit{grid} = \textit{False}, & \textit{interactive} = \textit{True}, \\ \textit{leaf\_color} = 'k', & \textit{leaf\_jitter} = \textit{False}, & \textit{leaf\_order} = 1, & \textit{leg-end\_pos} = 'best', & \textit{mirror} = \textit{False}, & \textit{persistence} = \textit{None}, \\ \textit{primary\_kw} = \textit{None}, & \textit{random\_state} = \textit{None}, & \textit{scale} = \textit{None}, \\ \textit{scaled leaf} = \textit{True}, & \textit{zoom} = \textit{None}) \end{array}
```

Scatter for numerical values based on leaf for X axis (scaled or not) and stem for Y axis

- **df** list, numpy array, time series, pandas or dask dataframe
- alpha opacity of the dots, defaults to 10%
- asc stem (Y axis) sorted in ascending order, defaults to True
- ax matplotlib axes instance, usually from a figure or other plot
- break_on force a break of the leaves at x in (5, 10), defaults to 10
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- delimiter_color color of the line between aggregate and stem and stem and leaf
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- **figure_only** bool if True (default) returns matplotlib (fig,ax), False returns (fig,ax,df)
- flip axes X becomes Y and Y becomes X
- font kw keyword dictionary, font parameters
- grid show grid
- **interactive** if plotly is available, renders as interactive plot in notebook. False to render image.
- leaf color font color of the leaves
- leaf jitter add jitter to see density of each specific stem/leaf combo
- leaf_order how many leaf digits per data point to display, defaults to 1
- legend_pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- mirror mirror the plot in the axis of the delimiters
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- primary_kw stem-and-leaf plot additional arguments
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- scaled leaf scale leafs, bool

• **zoom** – zoom level, on top of calculated scale (+1, -1 etc)

Returns

stemgraphic.graphic.stem graphic(df, alpha=0.1, df2=None,aggregation = True,asc=True, ax=None, ax2=None, bar color='C0', break on=None, column=None, bar outline=None, combined=None, compact=False, delimiter_color='C3', figure only=True, display=900, $flip \ axes = False,$ font kw=None, leaf color='k', leaf order=1, legend_pos='best', $median_alpha=0.25$, dian_color='C4', mirror=False, outliers=None. outliers color='C3'. persistence=None,priscale=None,mary_kw=None, random_state=None, secondary=False, $secondary_kw=None,$ $ondary_plot=None,$ $show_stem = True,$ title=None, trim=False, trim_blank=True, underline_color=None, unit=", zoom=None)

A graphical stem and leaf plot. stem_graphic provides horizontal, vertical or mirrored layouts, sorted in ascending or descending order, with sane default settings for the visuals, legend, median and outliers.

Parameters

- **df** list, numpy array, time series, pandas or dask dataframe
- **df2** string, filename, url, list, numpy array, time series, pandas or dask dataframe (optional). for back 2 back stem-and-leaf plots
- aggregation Boolean for sum, else specify function
- alpha opacity of the bars, median and outliers, defaults to 10%
- asc stem sorted in ascending order, defaults to True
- ax matplotlib axes instance, usually from a figure or other plot
- ax2 matplotlib axes instance, usually from a figure or other plot for back to back
- bar_color the fill color of the bar representing the leaves
- bar outline the outline color of the bar representing the leaves
- break on force a break of the leaves at x in (5, 10), defaults to 10
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- **combined** list (specific subset to automatically include, say, for comparisons), or None
- compact do not display empty stem rows (with no leaves), defaults to False
- **delimiter_color** color of the line between aggregate and stem and stem and leaf
- display maximum number of data points to display, forces sampling if smaller than len(df)
- **figure_only** bool if True (default) returns matplotlib (fig,ax), False returns (fig,ax,df)
- flip axes X becomes Y and Y becomes X
- font kw keyword dictionary, font parameters

8.4. graphic 43

- leaf color font color of the leaves
- leaf order how many leaf digits per data point to display, defaults to 1
- legend_pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- median_alpha opacity of median and outliers, defaults to 25%
- median color color of the box representing the median
- mirror mirror the plot in the axis of the delimiters
- outliers display outliers these are from the full data set, not the sample. Defaults to Auto
- outliers color background color for the outlier boxes
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- primary kw stem-and-leaf plot additional arguments
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- **secondary** bool if True, this is a secondary plot mostly used for back-to-back plots
- **secondary_kw** any matplotlib keyword supported by .plot(), for the secondary plot
- **secondary_plot** One or more of 'dot', 'kde', 'margin_kde', 'rug' in a comma delimited string or None
- show_stem bool if True (default) displays the stems
- **title** string to display as title
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- underline_color color of the horizontal line under the leaves, None for no display
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns matplotlib figure and axes instance

8.5 helpers

helpers.py

Helper functions for stemgraphic.

```
stemgraphic.helpers.APOSTROPHE = '''
```

Typographical apostrophe - ex: I'm, l'arbre

List of non alpha characters. Temporary - I want to balance flexibility with convenience, but still looking at options.

stemgraphic.helpers.NO_PERIOD_FILTER = ['\t', '\n', '\\', '/', '`', '*', '_', '\\', ']', '[
Similar purpose to CHAR_FILTER, ut keeps the period. The last word of each sentence will end with
a ': Useful for manipulating the dataframe returned by the various visualizations and ngram_data, to
break down frequencies by sentence instead of the full text or list.

```
stemgraphic.helpers.OVER = b'\xd6\xb1'
for typesetting overlap
```

stemgraphic.helpers.**QUOTE = "'"**Straight quote mark - ex: 'INCONCEIVABLE'

stemgraphic.helpers.jitter(data, scale)
Adds jitter to data, for display purpose

Parameters

- data numpy or pandas dataframe
- scale -

Returns

stemgraphic.helpers.key_calc (stem, leaf, scale)
Calculates a value from a stem, a leaf and a scale.

Parameters

- stem -
- leaf -
- scale -

Returns calculated values

 $stemgraphic.helpers. \textbf{legend} (\textit{ax}, \textit{x}, \textit{y}, \textit{asc}, \textit{flip_axes}, \textit{mirror}, \textit{stem}, \textit{leaf}, \textit{scale}, \textit{delimiter_color}, \textit{aggregation} = \textit{True}, \textit{cur_font} = \textit{None}, \textit{display} = 10, \\ \textit{pos} = \textit{'best'}, \textit{unit} = \textit{"})$

Builds a graphical legend for numerical stem-and-leaf plots.

Parameters

- display -
- cur font -
- ax -

8.5. helpers 45

- x -
- y -
- pos -
- asc -
- flip_axes -
- mirror -
- stem -
- leaf -
- scale -
- delimiter color -
- unit -
- aggregation -

```
stemgraphic.helpers.mapping = {'arabic': {'0': ''', '1': '\'', '2': '\'', '3': '\'', '4': '\''

Charset mappings
```

```
stemgraphic.helpers.min_max_count(x, column=0)
```

Handles min, max and count. This works on numpy, lists, pandas and dask dataframes.

Parameters

- **x** list, numpy array, series, pandas or dask dataframe
- column future use

Returns min, max and count

```
stemgraphic.helpers.na_count(x, column=0)
    min max count
```

Handles min, max and count. This works on numpy, lists, pandas and dask dataframes.

Parameters

- **x** list, numpy array, series, pandas or dask dataframe
- column future use

Returns all numpy nan count

```
stemgraphic.helpers.percentile(data, alpha)
```

Parameters

- data list, numpy array, time series or pandas dataframe
- alpha between 0 and 0.5 proportion to select on each side of the distribution

Returns the actual value at that percentile

```
stemgraphic.helpers.savefig(plt)
```

Returns

```
\verb|stemgraphic.helpers.stack_columns| (\textit{row})
```

stack multiple columns into a single stacked value :param row: a row of letters :return: stacked string

8.6 num

stemgraphic.num.

BRAND NEW in V.0.5.0!

Stemgraphic provides a complete set of functions to handle everything related to stem-and-leaf plots. num is a module of the stemgraphic package to handle numerical variables.

This module structure is new as of v.0.5.0 to match the addition of stemgraphic.alpha.

The shorthand from previous versions of stemgraphic is still available and defaults to the numerical functions:

from stemgraphic import stem_graphic, stem_text, heatmap

8.7 stopwords

stopwords

This module includes 4 lists of stop words: EN (main English list), ALT_EN (alternate English list), FR (French) and SP (Spanish).

A PT (Portuguese) list is in the works.

8.8 text

```
\label{eq:compact}  stemgraphic.text. \textbf{heatmap} (\textit{df}, \textit{caps=None}, \textit{charset=None}, \textit{column=None}, \textit{compact=True}, \textit{display=900}, \textit{flip\_axes=False}, \textit{leaf\_order=1}, \textit{outliers=None}, \textit{persistence=None}, \textit{random\_state=None}, \textit{scale=None}, \textit{trim=False}, \textit{trim\_blank=True}, \textit{unit="}, \textit{zero\_blank=True}, \textit{zoom=None})
```

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the leaves, they are left in their respective columns. Row '42' and Column '7' would have the count of numbers starting with '427' of the given scale.

The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

Example:

8.6. num 47

```
heatmap(diamonds.carat, charset='bold');
```

Output:

| Stem- | and- | leaf | hea | tmap | (30 | .1 x | 0. | 1) | | | |
|-------|------|------|-----|------|-----|------|----|-----|--|--|--|
| | | | | | | | | | | | |
| stem | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |

- df list, numpy array, time series, pandas or dask dataframe
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip_axes wide format
- leaf order how many leaf digits per data point to display, defaults to 1
- outliers for compatibility with other text plots
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- \mathtt{trim} ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None

- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- zero blank replace zero digit with space
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns count matrix, scale

```
\label{eq:compact} \begin{split} \text{stemgraphic.text.} \textbf{heatmatrix} (\textit{df}, \textit{caps=None}, \textit{charset=None}, \textit{column=None}, \textit{compact=False}, \\ \textit{display=900}, \textit{flip\_axes=False}, \textit{leaf\_order=1}, \textit{outliers=None}, \\ \textit{persistence=None}, & \textit{random\_state=None}, & \textit{scale=None}, \\ \textit{trim=False}, & \textit{trim\_blank=True}, & \textit{unit="}, & \textit{zero\_blank=False}, \\ \textit{zoom=None}) \end{split}
```

heatmap

The heatmap displays the same underlying data as the stem-and-leaf plot, but instead of stacking the leaves, they are left in their respective columns. Row '42' and Column '7' would have the count of numbers starting with '427' of the given scale.

The heatmap is useful to look at patterns. For distribution, stem_graphic is better suited.

Example:

```
heatmatrix(diamonds.carat, charset='bold');
```

Output:

| Stem- | and- | leaf | hea | tmap | (24.0×0.1) | | | 1) | |
|-------|------|------|-----|------|---------------------|--|--|-----|--|
| | | | | | | | | | |
| stem | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |

8.8. text 49

Parameters

- **df** list, numpy array, time series, pandas or dask dataframe
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes wide format
- leaf order how many leaf digits per data point to display, defaults to 1
- outliers for compatibility with other text plots
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- trim ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- trim_blank remove the blank between the delimiter and the first leaf, defaults to True
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- zero_blank replace zero digit with space
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns count matrix, scale

 $stemgraphic.text. \textbf{quantize} (\textit{df}, & column=None, & display=750, & leaf_order=1, & random_state=None, & scale=None, & trim=None, & zoom=None) \\ Converts a series into stem-and-leaf and back into decimal. This has the potential effect of decimating (or truncating) values in a lossy way.$

- df list, numpy array, time series, pandas or dask dataframe
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- display maximum number of data points to display, forces sampling if smaller than len(df)
- leaf order how many leaf digits per data point to display, defaults to 1
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

Returns decimated df

Returns scale factor, key label and list of rows.

Parameters

- **x** list, numpy array, time series, pandas or dask dataframe
- break on force a break of the leaves at x in (5, 10), defaults to 10
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- full bool, if True returns all interim results including sorted data and stems
- leaf_order how many leaf digits per data point to display, defaults to 1
- outliers display outliers these are from the full data set, not the sample. Defaults to Auto
- omin float, if already calculated, helps speed up the process for large data sets
- omax float, if already calculated, helps speed up the process for large data sets
- persistence persist sampled dataframe
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic)
- total_rows int, if already calculated, helps speed up the process for large data sets
- trim ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

```
\label{eq:compact} \begin{array}{lll} \texttt{stem\_dot}(\textit{df}, \; \textit{asc=True}, \; \textit{break\_on=None}, \; \textit{column=None}, \; \textit{compact=False}, \\ \textit{display=300}, \; \textit{flip\_axes=False}, \; \textit{leaf\_order=1}, \; \textit{legend\_pos='best'}, \\ \textit{marker=None}, \; \; \textit{outliers=True}, \; \; \textit{persistence=None}, \; \; \textit{random\_state=None}, \; \; \textit{scale=None}, \; \; \textit{symmetric=False}, \; \; \textit{trim=False}, \\ \textit{unit=", zoom=None}) \end{array}
```

stem_dot builds a stem-and-leaf plot with dots instead of bars.

Example:

```
stem_dot(diamonds.price)
```

Output:

```
326
;
0□
```

8.8. text 51

(continued from previous page)

- df list, numpy array, time series, pandas or dask dataframe
- asc stem sorted in ascending order, defaults to True
- break on force a break of the leaves at x in (5, 10), defaults to 10
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes bool, default is False
- legend pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- marker char, symbol to use as marker. '' is default. Suggested alternatives: '*', '+', 'x', ':, 'o'
- outliers display outliers these are from the full data set, not the sample. Defaults to Auto
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- symmetric if True, dot plot will be distributed on both side of a center line
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None

- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

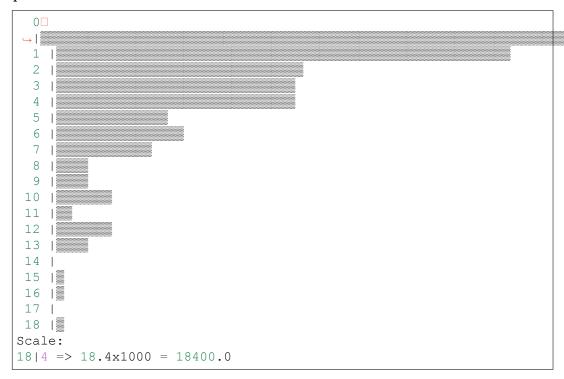

```
\label{eq:compact} \begin{array}{lll} \texttt{stem\_hist}(\textit{df}, \textit{asc=True}, \textit{break\_on=None}, \textit{column=None}, \textit{compact=False}, \\ \textit{display=300}, \textit{flip\_axes=False}, \textit{leaf\_order=1}, \textit{legend\_pos='best'}, \\ \textit{marker=None}, & \textit{outliers=True}, & \textit{persistence=None}, & \textit{random\_state=None}, & \textit{scale=None}, & \textit{shade=None}, & \textit{symmetric=False}, \\ \textit{trim=False}, & \textit{unit="}, & \textit{zoom=None}) \end{array}
```

stem_hist builds a histogram matching the stem-and-leaf plot, with the numbers hidden, as shown on the cover of the companion brochure.

Example:

```
stem_hist(diamonds.price, shade='medium')
```

Output:

Parameters

- **df** list, numpy array, time series, pandas or dask dataframe
- asc stem sorted in ascending order, defaults to True
- break on force a break of the leaves at x in (5, 10), defaults to 10
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes bool, default is False

8.8. text 53

- legend pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- marker char, symbol to use as marker. 'O' is default. Suggested alternatives: '*', '+', 'x', ':, 'o'
- outliers display outliers these are from the full data set, not the sample. Defaults to Auto
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- shade shade of marker: 'none', 'light', 'medium', 'dark', 'full'
- symmetric if True, dot plot will be distributed on both side of a center line
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

```
\label{eq:compact} \begin{array}{lll} \text{stem\_tally} (\textit{df}, & \textit{asc=True}, & \textit{break\_on=None}, & \textit{column=None}, & \textit{com-pact=False}, & \textit{display=300}, & \textit{flip\_axes=False}, & \textit{legend\_pos='best'}, \\ & \textit{outliers=True}, & \textit{persistence=None}, & \textit{random\_state=None}, \\ & \textit{scale=None}, & \textit{symmetric=False}, & \textit{trim=False}, & \textit{unit="'}, \\ & \textit{zoom=None}) \end{array}
```

Stem-and-leaf plot using tally marks for leaf count, up to 5 per block.

Example:

(continues on next page)

(continued from previous page)

```
!
18823
Key:
18|3 => 18.3x1000 = 18300.0
```

Parameters

- df list, numpy array, time series, pandas or dask dataframe
- asc stem sorted in ascending order, defaults to True
- break on force a break of the leaves at x in (5, 10), defaults to 10
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- **display** maximum number of data points to display, forces sampling if smaller than len(df)
- flip axes bool, default is False
- legend pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- outliers display outliers these are from the full data set, not the sample. Defaults to Auto
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- symmetric if True, dot plot will be distributed on both side of a center line
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)

```
\label{eq:compact} \begin{split} \texttt{stemgraphic.text.stem\_text}(\textit{df}, & \textit{asc=True}, & \textit{break\_on=None}, & \textit{charset=None}, & \textit{column=None}, & \textit{compact=False}, & \textit{display=300}, & \textit{flip\_axes=False}, \\ & \textit{legend\_pos='best'}, & \textit{outliers=True}, & \textit{persistence=None}, & \textit{random\_state=None}, & \textit{scale=None}, & \textit{symmetric=False}, & \textit{trim=False}, \\ & \textit{unit=", zoom=None}) \end{split}
```

stem_text.

Classic text based stem-and-leaf plot.

Parameters

- ${\tt df}-{\tt list},$ numpy array, time series, pandas or dask dataframe
- asc stem sorted in ascending order, defaults to True
- break on force a break of the leaves at x in (5, 10), defaults to 10

8.8. text 55

- charset (default to ascii), 'roman', 'rod', 'arabic', 'circled', 'circled_inverted'
- column specify which column (string or number) of the dataframe to use, else the first numerical is selected
- compact do not display empty stem rows (with no leaves), defaults to False
- display maximum number of data points to display, forces sampling if smaller than len(df)
- flip_axes bool, default is False
- legend pos One of 'top', 'bottom', 'best' or None, defaults to 'best'.
- outliers display outliers these are from the full data set, not the sample. Defaults to Auto
- **persistence** filename. save sampled data to disk, either as pickle (.pkl) or csv (any other extension)
- random_state initial random seed for the sampling process, for reproducible research
- scale force a specific scale for building the plot. Defaults to None (automatic).
- symmetric if True, dot plot will be distributed on both side of a center line
- **trim** ranges from 0 to 0.5 (50%) to remove from each end of the data set, defaults to None
- unit specify a string for the unit ('\$', 'Kg'...). Used for outliers and for legend, defaults to ''
- **zoom** zoom level, on top of calculated scale (+1, -1 etc)
